Regression Models Course Project

Executive Summary

This is a project for the Regression Models course, part of the John Hopkins University Data Science Specialization on Coursera. Using the mtcars dataset, this project answers the following questions:

- * Is an automatic or manual transmission better for MPG?
- * Quantify the MPG difference between automatic and manual transmissions.

Data Description

The mtcars data was extracted from the 1974 Motor Trend US magazine, and comprises fuel consumption and 10 aspects of automobile design and performance for 32 automobiles (1973–74 models). It is stored as a data frame with 32 observations on 11 (numeric) variables. [, 1] mpg Miles/(US) gallon

```
[, 2] cyl Number of cylinders
[, 3] disp Displacement (cu.in.)
[, 4] hp Gross horsepower
[, 5] drat Rear axle ratio
[, 6] wt Weight (1000 lbs)
[, 7] qsec 1/4 mile time
[, 8] vs Engine (0 = V-shaped, 1 = straight)
[, 9] am Transmission (0 = automatic, 1 = manual)
[,10] gear Number of forward gears
[,11] carb Number of carburetors
```

\$ disp: num 160 160 108 258 360 ...

\$ wt : num 2.62 2.88 2.32 3.21 3.44 ... ## \$ qsec: num 16.5 17 18.6 19.4 17 ...

Data Processing

```
# Load data and packages
library(ggplot2)
library(MASS)
data(mtcars)

# Convert categorical variables to factors
mtcars$cyl <- factor(mtcars$cyl)
mtcars$vs <- factor(mtcars$vs)
mtcars$am <- factor(mtcars$am, labels=c('Automatic','Manual'))
mtcars$gear <- factor(mtcars$gear)
mtcars$carb <- factor(mtcars$carb)

# Examine data
str(mtcars)</pre>
## 'data.frame': 32 obs. of 11 variables:
```

\$ mpg : num 21 21 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 ...
\$ cyl : Factor w/ 3 levels "4","6","8": 2 2 1 2 3 2 3 1 1 2 ...

\$ drat: num 3.9 3.9 3.85 3.08 3.15 2.76 3.21 3.69 3.92 3.92 ...

\$ hp : num 110 110 93 110 175 105 245 62 95 123 ...

```
## $ vs : Factor w/ 2 levels "0","1": 1 1 2 2 1 2 1 2 2 2 ...

## $ am : Factor w/ 2 levels "Automatic","Manual": 2 2 2 1 1 1 1 1 1 1 ...

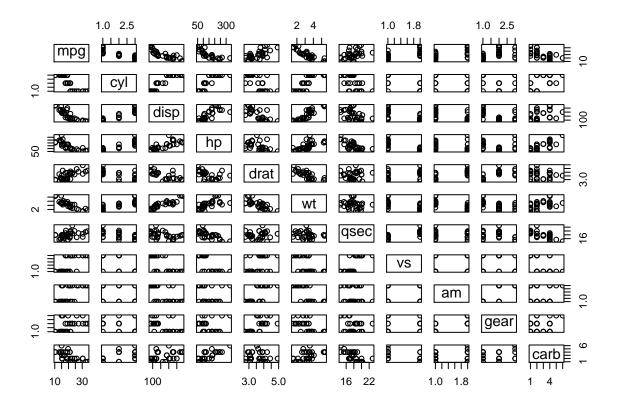

## $ gear: Factor w/ 3 levels "3","4","5": 2 2 2 1 1 1 1 2 2 2 ...

## $ carb: Factor w/ 6 levels "1","2","3","4",..: 4 4 1 1 2 1 4 2 2 4 ...
```

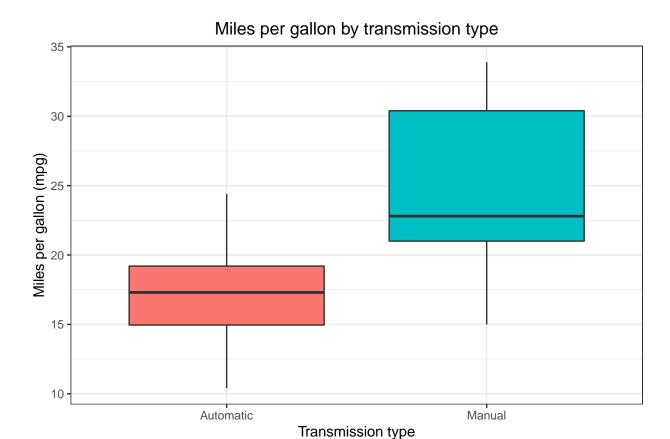

Exploratory Data Analysis

First, let's briefly examine any relationships between the variables

```
pairs(mpg ~ ., data = mtcars)
```

Let's also get a sense of the mean and spread of MPG by transmission type

On first glance, it looks like manual transmission tends to have higher fuel efficiency (mpg). We will formally test this hypothesis in a regression analysis.

Regression Analysis

Model fitting and selection

We first fit a simple linear regression model to test the relationship between transmission type and mpg.

```
linearfit <- lm(mpg ~ am, data = mtcars)
summary(linearfit)</pre>
```

```
##
## Call:
## lm(formula = mpg ~ am, data = mtcars)
##
## Residuals:
       Min
                                 ЗQ
##
                1Q Median
                                        Max
## -9.3923 -3.0923 -0.2974 3.2439
                                    9.5077
##
## Coefficients:
               Estimate Std. Error t value Pr(>|t|)
##
                             1.125 15.247 1.13e-15 ***
## (Intercept)
                 17.147
                  7.245
## amManual
                              1.764
                                      4.106 0.000285 ***
## ---
```

```
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 4.902 on 30 degrees of freedom
## Multiple R-squared: 0.3598, Adjusted R-squared: 0.3385
## F-statistic: 16.86 on 1 and 30 DF, p-value: 0.000285
```

The R-squared estimate shows that only about 36% of the variation in mpg is explained by the model, indicating that we need to control for other variables in the model.

Next, we will fit a multivariable regression model with all variables included, then perform a stepwise variable selection using the stepAIC() function to determine which variables to include in the final model, with smaller AIC values indicating better model fit.

```
# Fit model
multifit <- lm(mpg ~ ., data = mtcars)
# Select model
bestfit <- stepAIC(multifit, direction = "both")</pre>
```

summary(bestfit)

```
##
## lm(formula = mpg ~ cyl + hp + wt + am, data = mtcars)
##
## Residuals:
##
      Min
                1Q Median
                                3Q
                                      Max
## -3.9387 -1.2560 -0.4013 1.1253 5.0513
##
## Coefficients:
##
              Estimate Std. Error t value Pr(>|t|)
## (Intercept) 33.70832
                           2.60489

## cy18
                           2.28425
              -0.03211
                           0.01369
                                   -2.345 0.02693 *
## hp
               -2.49683
## wt
                           0.88559
                                   -2.819 0.00908 **
               1.80921
                           1.39630
                                     1.296 0.20646
## amManual
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
## Residual standard error: 2.41 on 26 degrees of freedom
## Multiple R-squared: 0.8659, Adjusted R-squared: 0.8401
## F-statistic: 33.57 on 5 and 26 DF, p-value: 1.506e-10
```

We see that the final model consists of cyl, hp, and wt as covariates, with mpg as outcome and am as predictor. In addition, about 87% of variance in mpg is now explained by the model, indicating better model fit.

Inference

- 1. The expected mpg with manual transmission is about 1.81 greater than auto transmission.
- 2. However, the p-value for manual versus auto transmission (reference) is about 0.206, greater than the standard threshold of 0.05. Hence, we cannot conclusively say that manual transmission results in better mpg, compared to auto transmission.

We can confirm this with by estimating the confidence interval.

```
confint(bestfit, "amManual", level = 0.95)

## 2.5 % 97.5 %
## amManual -1.060934 4.679356
```

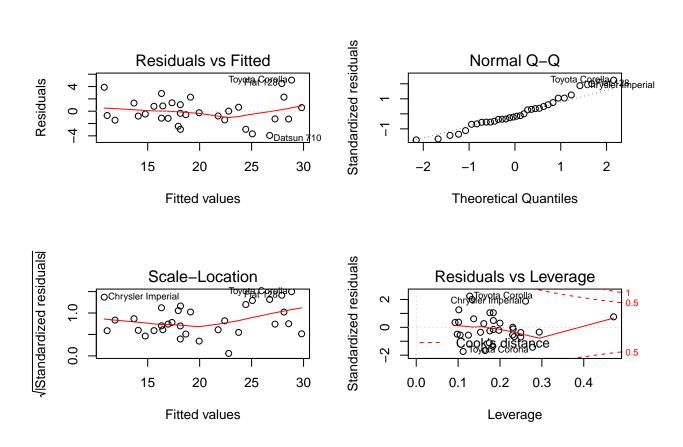

The confidence interval overlaps with 0, indicating non-signficance.

Conclusions

The difference in mpg between auto and manual transmission is not statistically significant. We cannot conclude that either type of transmission has better mpg than the other.

Appendix - Diagnostics

```
# Plot residuals
par(mfrow = c(2, 2))
plot(bestfit)
```

Find 5 most influential points on slope coefficients influence <- dfbetas(bestfit) head(sort(influence[,6], decreasing = TRUE), 5)</pre>
